PhD in Physics - University of Ferrara

Thesis Title: Simultaneous spectral and temporal properties of Galactic X-ray Binaries.

Summary: Three sources were analyzed in terms of spectral and temporal variability.

The *Z*-sources GX 340+0 has been studied using the bulk motion comptonization models BMC and COMPTB, in comparison with the classical description with thermal comptonization (COMPTT) or phenomenological models (PL). The black hole candidate 4U 1630-47 as been also studied in terms of bulk and thermal comptonization models, and on the basis of the relation between temporal and spectral parameters, an estimated mass has been obtained, by using the scaling method (Titarchuk et al. 2009). The same method has also been applied to the still unknown source Cyg X-3 and the results seems to be in favor of presence of a central black hole.

Advisors: Proff. F. Frontera and L. Titarchuk.

External Committee Members: Proff. Z. Berezhiani, M. Vietri, L. Burderi, T. Di Salvo

Evaluation: Excellent.

Degree in Physics - University of Ferrara

Thesis Title: La natura delle binarie X di piccola massa ad alta luminosità: il caso di GX 3+1 osservata con INTEGRAL.

Summary: The Thesis explored the behavior of the galactic low mass x-ray binary source GX 3+1 in terms of spectral variability. I have studied its spectral behavior during two different epochs and found evidence of hard tail in a sub-set of observations. Furthermore, the Color-Color Diagram (CD) resembled that of *Z*-sources, suggesting that bright Atoll sources represents an intermediate class between the classical Atoll and the *Z* class. **Advisors:** Prof. F. Frontera & Dr. R. Farinelli.
